DR. JOHN F. ANDERSON

August 18, 1926

A doctor of Medicine acting as Director of Squib's New Brunswick Research Laboratory.

TESTIFIED (page 523cet seq.):

Recited his qualifications as expert and that he had specialized in analysis to determine amounts of blood and identification of blood stains (523%c)

On October 2, 1922 received 158 pounds of soil, etc. from scene. A description of work he did (524-5).

In Anderson's opinion throat was cut after death because living people bleed more freely (526).

Would expect to find six pints of blood from a throat cut while heart was beating. Only found about 8/10 of a pint (526).

Could not tell from analysis whether victims killed at spot but they were in his opinion (526-7).

CROSSEXAMINATION:

In Anderson's opinion throat must have been cut within half an hour after Mrs. Mills was shot (527).
